

FAST TRACK PATHWAY FOR DIABETES-RELATED FOOT ULCERATION

Toolbox for DFU management in Primary Care

Diabetes Metabolic Control

- HbA1c
- Glycemia
- Diet
- Activity
- Medication

Vascular status

- Pulse palpation
- Skin features:
- Pale
- Cyanosis
- Cold
- Absence of leg hair

Comorbidities

- Chronic Kidney Disease
- Cardiovascular Disease
- Obesity
- Hypertension
- Dyslipidemia

Debridement

Type

- Sharp/Surgical
- Autolytic

Recommendations

- Sterile and prescribed solutions
- Avoid common disinfectant
- Avoid self-made solutions

Discard infection

LOCAL

- Probe-to-Bone Test
- Pain/Tenderness
- Local warmth
- Cellulitis
- Pus
- Others:
 - Friable wound bed tissue
 - Exudate increase
 - Undermining edge
 - Fistulous track
- Bad odour

SYSTEMIC

- Fever
- Asthenia/Anorexia
- Flogistic indexes increased

Offloading

Location of the ulcer

- Plantar/dorsal/lateral
- Forefoot/midfoot/rearfoot

Activity

- Sedentarism
- Active (outdoors/indoors)

Deformities

- Bone prominences
- Rigid foot
- Charcot foot

Dressing selection

Antimicrobial dressing and close monitoring of the ulcer to avoid infection worsening or spreading

2. Sucrose Octasulfate (TLC-NOSF) impregnated dressing

- Neuroischaemic DFU from Day 0
- Non improved ulcers (less than 30% improvement after 2 weeks)
- 3. Non complicated DFU (No Peripheral Artery Disease, No Ischemia, No Infection)

Select dressing principally on the basis of exudate control, comfort and cost

Alarm signs

LOCAL

- Granulation tissue less effective
- Redness
- Pain

SYSTEMIC

- Increase glycemiaFever
- rever
- Astenia/anorexia
- Flogistic indexes increased
- Pain

LOCAL

- Necrosis of the edge
- Cyanosis
- Less progress of the wound

SYSTEMIC

• Pain

FAST TRACK PATHWAY FOR DIABETES-RELATED FOOT ULCERATION

AT FIRST PRESENTATION MAP PATIENT RISK FACTORS

HOLISTIC APPROACH

- Medical / surgical / social history
- · Laboratory tests
- Clinical examinations
- Nutritional status
- · Quality of life

HIGH RISK CO-MORBIDITIES

- Cardiovascular disease
- · Respiratory disease
- · End stage renal disease
- Immunosuppressed

Depression

- · Endrocrine disease
- Cancer therapies
- · Glycaemic control
- · Sepsis risk

LOWER LIMB ASSESSMENT

- Vascular and neurological
- · Venous drainage
- · Lymphatic system disease
- · Tissue intregrity / viability
- · Deformity
- Infection indicators IDSA
- Neuropathic arthropathy

WOUND ASSESSMENT

- Epidemiology / aetiology
- · Wound classification
- SINBAD score
- Pain scoring
- TIME
- Exudate/ malodour

HIGH-RISK DIABETES FOOT ULCER RISK MANAGEMENT

NON COMPLEX ULCERATION

PALPABLE PULSES
NO CLINICAL SIGNS OF INFECTION
SINBAD SCORE 0-2

EXAMPLE ONLY

Community Health Podiatrist or Private Podiatrist

Implement Standard of Care as outlined below

Expect 50% reduction in wound surface area within 4 weeks. If not achieving in this time, refer to a High Risk Foot Service (HRFS) within your local area.

For a list of HRFS visit:

https://nadc.net.au/footforward/hrfs-clinic-list/ or www.savefeetsavelivesaustralia.com

COMPLEX ULCERATION

NON PALPABLE PULSES CLINICAL SIGNS OF INFECTION NON HEALING OR DETERIORATING WOUND INCREASED MALODOUR / EXUDATE / PAIN

SINBAD SCORE 3 - 6

If Infected treat with Antibiotics in line with antimicrobial guidelines

Implement Standard of Care + refer to the High Risk Foot Service at your nearest hospital (max. delay of 4 days)

Consider a GP referral to the Vascular Department at your nearest hospital for further vascular imaging and assessment

RISK TO LIFE AND LIMB

SEPSIS INDICATORS CRITIAL WOUND DETERIORATION

ACUTE LIMB ISCHAEMIA
OR CHRONIC LIMBTHREATENING ISCHAEMIA

EMERGENCY REFERRAL

EMERGENCY REFERRAL

Your nearest Hospital Emergency Department

Ph: (03)

Once stabilised, hospital to admit and refer patient to the High Risk Foot Service within the hospital On discharge, patient to be referred to an appropriate community based HRF podiatry service

STANDARD OF CARE

OFFLOADING: Reduction of extrinsic +/- intrinsic biomechanical stress/plantar pressure is essential for ulcer protection and healing. The use of Non-removable knee-high offloading devices, total contact casts (TCC), removable walkers or specific footwear should be tailored to individual need and according to local available resources. Patients should be educated to minimise standing and walking. Regular follow-up should be undertaken to ensure clinical effectiveness and compliance.

RESTORATION OF PERFUSION: In patients with peripheral arterial disease (ankle pressure <50mmHg, ABI <0.5, toe pressure <30mmHg or TCPO2 <25mmHg), revascularisation should be considered. When an ulcer does not

show signs of healing within 4 weeks, despite optimal management, further vascular assessment and revascularisation should be considered (even if tests above fall within acceptable / normal ranges)

TREATMENT OF INFECTION: Where there are clinical signs of infection, empiric and broad-spectrum antibiotic therapy should be administered after obtaining microbiological samples (ideally deep tissue), followed by adjustments according to clinical response and microbiological results. Removal of any necrotic or nonviable tissue following comprehensive assessment of infection severity is required.

METABOLIC CONTROL/HOLISTIC MANAGEMENT: Metabolic approach requires optimisation of glycaemic control (if necessary with insulin), the treatment of malnutrition and oedema if present. Optimal management of relevant comorbidities is mandatory.

LOCAL WOUND CARE: Frequent ulcer inspection/assessment debridement and redressings should be undertaken. Dressing selection is based upon ulcer findings (characteristics of wound bed, exudate, size, depth, local pain). In neuro-ischaemic ulcers, dressing with TLC-NOSF (Lipido-Colloid Technology with Nano-OligoSaccharide Factor) should be considered.
